

VITAMIN D3

Protect your body against the lasting effects of Vitamin D3 shortages.

Vitamin D3 is one of the most useful nutritional tools we have at our disposal for improving our overall health. The body is equipped with the amazing ability to synthesize this essential vitamin through exposure to the sun's ultraviolet rays.

Studies have shown that fifteen to twenty minutes of daily sun exposure will manufacture an approximate 10,000 to 15,000 units of vitamin D3 in your body. However, with today's indoor living and extensive use of sunscreen due to the rising concern of skin cancer, we now live in a society where millions of individuals are deficient in this life-sustaining, bone building vitamin.

Vitamin D3's effect on the body's numerous biological functions is vital to our health and well-being. Vitamin D3 deficiency has been implicated in a variety of health issues.

Of the many roles vitamin D3 fulfills in the human body, one of its most important is to enable calcium absorption. The body is unable to digest calcium without adequate levels of D3. Insufficient levels of calcium in the body can lead to osteoporosis and eventually bone loss.

Like a ray of sunshine, Synergy's Vitamin D3 benefits the body's numerous biological functions to promote a greater state of overall health.
